

Enhance Your AD12 with Our New Cake Feeder!

For a more semi-automatic workflow, simply replace the extruders with our Cake Feeder. This innovative unit makes it easier to load specialty pucks for vinyl record production – ideal for splatter effects, multi-color combinations, and other creative designs.

With the Cake Feeder, loading complex color variations becomes much more efficient, while operators benefit from a smoother and more controlled workflow compared to only upgrading with a splatter kit.

FEATURES

- Easier loading of various splatter effects
- Handles pucks with multi-color setups
- Provides a calmer and more controlled workflow for the operator.
- Compatible with any standalone extruder.
- Flattens the puck before loading into the AD12.

When purchasing Pheenix's new Cake Feeder, the existing extruder will be converted into a standalone extruder with its own interface, allowing it to operate independently. This means the same extruder can run in automatic mode together with the AD12 or be used separately.

When the new Cake Feeder is installed, the AD12 will be operated manually with a button after loading a puck. Integrated light curtains ensure that the machine remains safe to use. Cake feeder will be connected to the AD12 for power and air.
